

OPS-29 Forest Fire Discussion II

Forest Fire Discussion II

The sun, (not CO2) is the primary climate driver!

The fire seasons in California (2017/18) and Australia ((2019/20) were front page news and heralded widely by the Catastrophic Anthropogenic Warming (CAGW) alarmist crowd as evidence of the existential threat of CO₂ emissions. Strange that the historical data just doesn't support that hypothesis. CO₂ DOES NOT correlate to the fire statistics.

As an aside, finding historical information on forest fires is a frustrating exercise. Canada cuts off the readily accessible data at 1950 (as they did with temperature). Australia searches were almost useless (so I'm relying on the Dr. Roy Spencer analysis). Australia had some horrific temperatures, drought, fires prior to 1900 that aren't part of the analysis. California had no easily accessible data prior to 2000.

The next time someone tries to link CO₂ emissions (i.e.: "Climate Change") and Forest Fires (and someone will), point out the facts!!!
