

GSM - Grand Solar Minimum. The real "Climate Change" existential threat is right around the corner. Do the Research!

OPS-52 Solar Activity - NOAA Forecast

This post expands on the small graph on the last page (CSS-12h) of last week's post. NOAA is forecasting a GSM and our idiotological leaders should start paying attention! The Northern Hemisphere cools during every solar minimum and cools dramatically every Grand Solar Minimum (GSM) every 400 years. The Maunder GSM was a very cold period with severe cold related crop losses that led to mass starvation, disease outbreaks and civil strife. As shown below, the temperature drops during Solar Minima have nothing to do with CO₂. The coming temperature drop will be more pronounced than either the Dalton or Centennial Minima and the IPCC computer models simply cannot recognize what is coming.

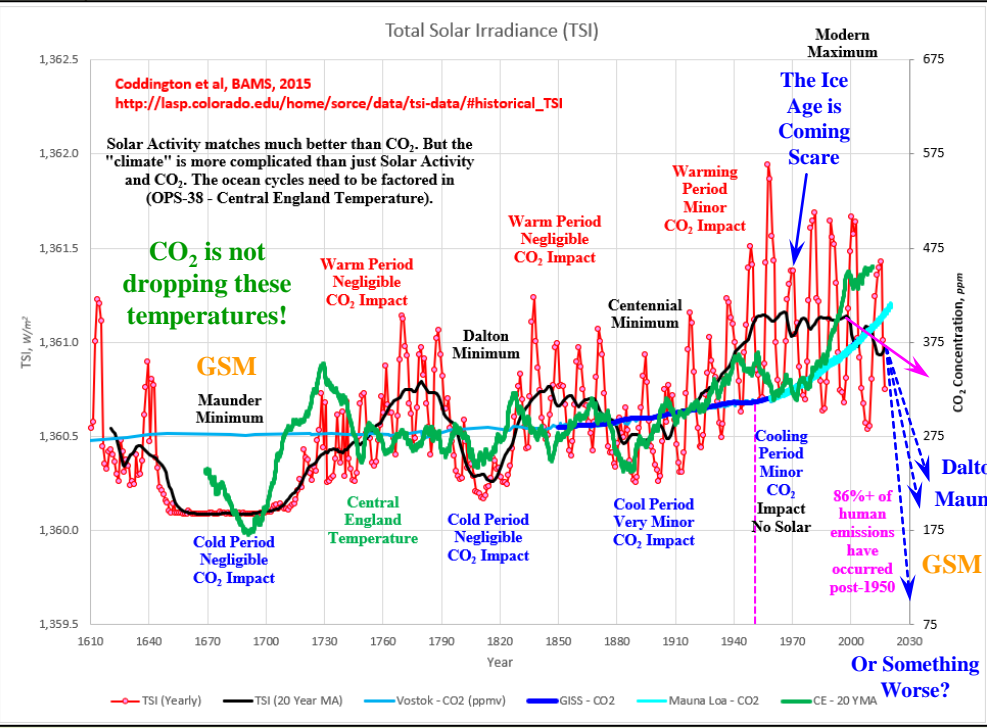

The CAGW alarmist Narrative will start changing soon as more of their trusted sources get on board with the GSM! NASA is next.

- OPS-8 Basic Climate Model
- OPS-22 Computer Models
- Real Simple
- Open Letter Addendum

Solar Activity NOAA Forecast

Note, SunSpots are a qualitative look at Solar Activity. The Total Solar Irradiance (TSI) is an excellent proxy for solar forcing. The TSI alone (the strategic (not scientific) approach by CAGW alarmists) is only a small portion of the sun's climate contributions.

All the narratives, all the word salad that the CAGW alarmists spew cannot change the simple fact that there is no empirical Temperature/CO₂ data set that shows CO₂ driving the climate on any statistically significant historical time scale. Conversely, solar related forcings (cosmic ray flux (cloud cover), ocean cycles, high energy particles, orbital cycles, etc.) are prominent throughout the historical data. #Showusthedata or admit the data does not exist?
