

GSM - Grand Solar Minimum. The real "Climate Change" existential threat is right around the corner. Do the Research!

OPPS-26 "The Science"

More detail? climatechangeandmusic.com

"The Science" is invoked constantly by our political leaders, their media minions, and their so-called "experts". But science is not a singular viewpoint (i.e.: not subject to consensus). Science continually evolves through skepticism, open debate and innovation (not by thoughtlessly falling in line and accepting the current narrative). This discussion focuses on "Climate Change" but the general concepts can easily be applied to the many other narratives currently being forced down our throats. Society (as a whole) needs to embrace Critical Thinking soon!

So, what is the state of "The Science"? In practical terms, "The Science" does not represent reality. The focus is on the computer models which self-admittedly run too hot and use low likelihood (implausible) emission scenarios. Not a good start since the only place temperatures increase to dangerous levels is in the virtual reality world created by the computer models. Does "The Science" have empirical data to back up their narrative? No, there are no empirical CO₂/Temperature datasets that show CO₂ driving the climate on any statistically significant historical time scale. "The Science" ignores virtually all the many, more powerful solar forcings (Cosmic Ray Flux, High Energy Particles, etc.), focusing on just the Total Solar Irradiance (TSI, a minor component). The AMO and GSM will both reduce temperatures over the next few decades. "The Science" ignores this dangerous reality (cold kills a lot more people than heat). "The Science" also ignores the benefits of more CO₂ (mild warming and fertilization). "The Science" is a simplistic, unscientific approach to "Climate Change"! We (the people) need to wake up en masse and soon!
