

GSM - Grand Solar Minimum. The real "Climate Change" existential threat is right around the corner. Do the Research!

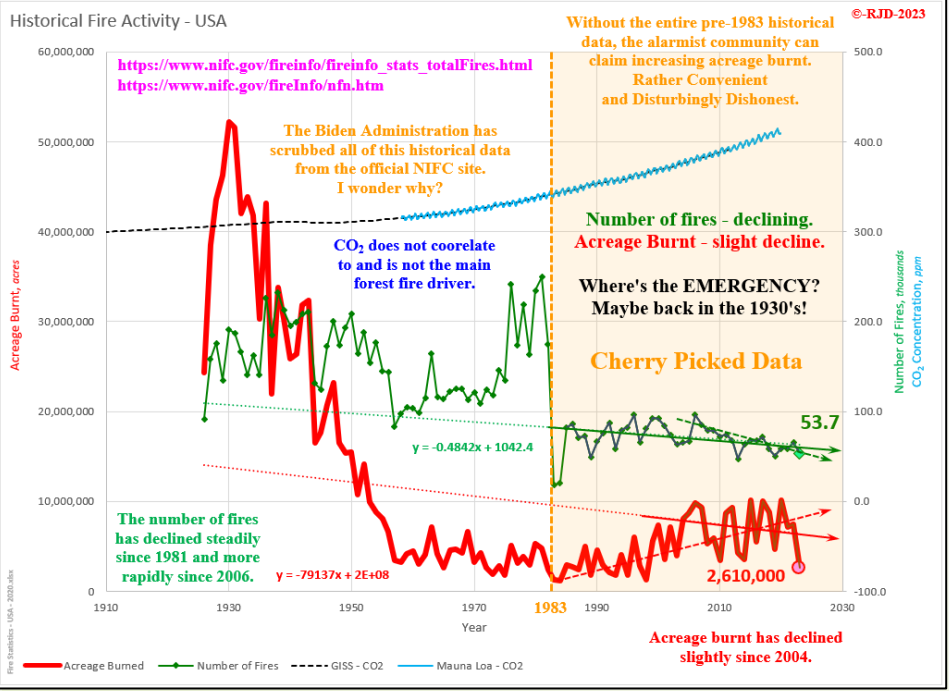

## OPS-76 Forest Fire 2023 Update

The Canadian fires (2023) gave the alarmist community all kinds of fodder to proclaim that the apocalyptic future they warn about is already here. There are a few problems with their narrative. CO<sub>2</sub> changes cannot be responsible for the increased/record acreage burnt in 2023.

## Forest Fires 2023 Update

The next time someone tries to link CO<sub>2</sub> emissions (i.e.: "Climate Change") and Forest Fires (and someone will), point out the lies and provide the facts!!!

Neither the 2020 record low (0.23 MH) nor the 2023 record high (18.5 MH) are due to CO<sub>2</sub>. 2023's anomalously high burn acreage is not consistent with either the burn acreage nor CO<sub>2</sub> trends, any more than the 1974/75 Australian bush fire season (112 MH) or the early 20<sup>th</sup> century US data. Despite the tragedy associated with localized forest fires, the global data is far more important when discussing climate. And the global data (below) does not correlate with CO<sub>2</sub> concentration increases. The general trend this century has been down, despite rising CO<sub>2</sub>!
